

Movement, Population Distribution and Social Dynamics of African Elephants in Kunene and Omusati Region of Namibia

A GPS-Collar study in the Kunene and Omasatie region of Namibia will research the elephant distribution, movements, and human-elephant conflicts in the area. This study will contribute to the conservation of elephants in Namibia by: 1) filling an important data gap on Omusati elephants, 2) continuing long term monitoring of desert-dwelling elephants in the Kunene, and 3) providing capacity-building for local people that will ultimately reduce human-elephant conflict in this region.
